

Previously, on Homological Algebra:

Ab abelian category

- An object P is projective if

$\text{Hom}_{\mathcal{A}b}(P, -)$ is exact

\Leftrightarrow

- An object E is injective if

$\text{Hom}_{\mathcal{A}b}(-, E)$ is exact

\Leftrightarrow

- A Projective resolution for M is a complex

$$P = \dots \rightarrow P_2 \rightarrow P_1 \rightarrow P_0 \rightarrow 0 \quad \text{such that}$$

$H_0(P) = M, H_n(P) = 0$ for all $n \neq 0$, and P_n is projective for all n

- An injective resolution for M is a (co)Complex

$$E = \dots \leftarrow E^1 \leftarrow E^0 \leftarrow 0 \quad \text{such that}$$

$H^n(E) = 0$ for all $n \neq 0, H^0(E) = M$, and E_n is injective for all n .

- $\mathcal{A}b$ has enough projectives if for every object M there exists an epi $P \rightarrow M$ with P projective

- $\mathcal{A}b$ has enough injectives if for every object M there exists a mono $M \rightarrow E$ with E injective

Example R -mod has enough projectives and enough injectives

things we will need today:

- \mathcal{F} additive functor $\mathcal{A}b \rightarrow \mathcal{B}$

\Rightarrow get a functor $\mathcal{F}: \text{Ch}(\mathcal{A}b) \rightarrow \text{Ch}(\mathcal{B})$

- Additive functors preserve homotopies

so if $\varphi \simeq \gamma \Rightarrow \mathcal{F}(\varphi) \simeq \mathcal{F}(\gamma)$

- A ses $0 \rightarrow A \xrightarrow{f} B \xrightarrow{g} C \rightarrow 0$ splits if

- $\exists q: B \rightarrow A$ with $qf = \text{id}_A$

- $\exists \pi: C \rightarrow B$ with $g\pi = \text{id}_B$

- $\cong 0 \rightarrow A \xrightarrow{i} A \oplus C \xrightarrow{\pi} C \rightarrow 0$

- A injective
or
 C projective $\Rightarrow 0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ splits

- Additive functors preserve split short exact sequences

$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ split ses

\Downarrow

$0 \rightarrow \mathcal{F}A \rightarrow \mathcal{F}B \rightarrow \mathcal{F}C \rightarrow 0$ split ses

Goal: for a ring R , get along Exact sequences for $\text{Hom}_R(M, -)$, $\text{Hom}_R(-, M)$, and $M \otimes_R -$

- $\text{Hom}_R(M, -)$ is left exact:

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0 \text{ ses}$$

$$\Downarrow$$

$$0 \rightarrow \text{Hom}_R(M, A) \rightarrow \text{Hom}_R(M, B) \rightarrow \text{Hom}_R(M, C) \rightarrow ?$$

- $\text{Hom}_R(-, M)$ is left exact:

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0 \text{ ses}$$

$$\Downarrow$$

$$0 \rightarrow \text{Hom}_R(M, C) \rightarrow \text{Hom}_R(M, B) \rightarrow \text{Hom}_R(M, A) \rightarrow ?$$

- $M \otimes_R -$ is right exact:

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0 \text{ ses}$$

$$\Downarrow$$

$$? \rightarrow M \otimes_R A \rightarrow M \otimes_R B \rightarrow M \otimes_R C \rightarrow 0$$

Solution derived functors.

\mathbb{P} projective

$$\Downarrow$$

$\text{Hom}_R(\mathbb{P}, -)$ exact

E injective

$$\Downarrow$$

$\text{Hom}_R(-, E)$ exact

\mathbb{I} projective

$$\Downarrow$$

$\mathbb{I} \otimes_R -$ exact

Derived functors of $\mathcal{A} \xrightarrow{F} \mathcal{B}$

\mathcal{A}, \mathcal{B} abelian

- F right exact covariant functor

If \mathcal{A} has enough projectives, the **left derived functors** of F are

$$\begin{cases} L_i F : \mathcal{A} \rightarrow \mathcal{B} & i \geq 0 \\ \bullet L_i F(A) := H^i(F(P)) & P \xrightarrow{\sim} A \text{ projective resolution} \\ \bullet L_i F(f) := H^i(F(\varphi)) & \begin{array}{l} A \xrightarrow{f} B \quad P \xrightarrow{\varphi} Q \text{ left of } f \\ Q \xrightarrow{\sim} B \text{ projective resolution} \end{array} \end{cases}$$

- F left exact covariant functor

If \mathcal{A} has enough injectives, the **right derived functors** of F are

$$\begin{cases} R^i F : \mathcal{A} \rightarrow \mathcal{B} & i \geq 0 \\ \bullet R^i F(A) := H^i(F(E)) & A \xrightarrow{\sim} E \text{ injective resolution} \\ \bullet R^i F(f) := H^i(F(\varphi)) & \begin{array}{l} A \xrightarrow{f} B \quad E \xrightarrow{\varphi} I \text{ left of } f \\ B \xrightarrow{\sim} I \text{ injective resolution} \end{array} \end{cases}$$

- F contravariant left exact functor

If \mathcal{A} has enough projectives, the **right derived functors** of F are

$$\begin{cases} R^i F : \mathcal{A} \rightarrow \mathcal{B} & i \geq 0 \\ \bullet R^i F(A) := H^i(F(P)) & P \xrightarrow{\sim} A \text{ projective resolution} \\ \bullet R^i F(f) := H^i(F(\varphi)) & \begin{array}{l} A \xrightarrow{f} B \quad P \xrightarrow{\varphi} Q \text{ left of } f \\ Q \xrightarrow{\sim} B \text{ projective resolution} \end{array} \end{cases}$$

• F contravariant right exact functor

If \mathcal{A} has enough injectives, the left derived functors of F are

$$L_i F : \mathcal{A} \rightarrow \mathcal{B}$$

$$\left\{ \begin{array}{l} \bullet L_i F(A) := H_i(F(E)) \\ \bullet L_i F(f) := H_i(F(\varphi)) \end{array} \right.$$

$$\left\{ \begin{array}{l} \bullet L_i F(A) := H_i(F(E)) \\ \bullet L_i F(f) := H_i(F(\varphi)) \end{array} \right.$$

$$A \xrightarrow{\sim} E \quad i \geq 0 \quad \text{injective resolution}$$

$$A \xrightarrow{f} B \quad E \xrightarrow{\varphi} I \quad \text{left } \mathcal{Q} f$$

$$B \xrightarrow{\sim} I \quad \text{injective resolution}$$

original functor is	Exactness	Use	take	derived functor
Covariant	Left	injectives	H^i	Covariant
	Right	projectives	H_i	Covariant
Contravariant	Left	projectives	H^i	Contravariant
	Right	injectives	H_i	Contravariant

Notes :

$$\bullet F \text{ exact} \Rightarrow H_i(F(C)) = F(H_i(C)) \Rightarrow \begin{cases} L_i F = 0 \\ R^i F = 0 \end{cases} \text{ for all } i > 0$$

$$\bullet P \text{ projective} \Rightarrow 0 \rightarrow P \rightarrow 0 \Rightarrow L_i F(P) = 0 \text{ for } i > 0$$

projective resolution

$$\bullet E \text{ injective} \Rightarrow 0 \rightarrow E \rightarrow 0 \Rightarrow R^i F(E) = 0 \text{ for } i > 0$$

injective resolution

Prop: An abelian category with enough projectives
 F covariant right exact functor

- ① $L_i F(A)$ well-defined up to iso for all objects A
- ② $L_i F(f)$ well-defined for every arrow $A \xrightarrow{f} B$
- ③ $L_i F$ additive functor
- ④ $L_0 F = F$ (naturally isomorphic)

Proof ① P, Q projective resolutions for A

\exists maps of complexes $P \xrightarrow{\varphi} Q \xrightarrow{\gamma} P$

Such that $\varphi\gamma \simeq 1_Q$ $\gamma\varphi \simeq 1_P$

Additive functors preserve homotopies

$\Rightarrow F(\varphi)F(\gamma) \simeq 1_{F(Q)}$, $F(\gamma)F(\varphi) \simeq 1_{F(P)}$

Homotopic maps induce the same map in homology

$\Rightarrow F(\varphi)$ and $F(\gamma)$ induce isos in homology

$\Rightarrow H_i(F(P)) \underset{\text{iso}}{\simeq} H_i(F(Q))$

② Fix projective resolutions $\mathcal{P} \xrightarrow{\sim} A$ and $Q \xrightarrow{\sim} B$

Any two lifts φ, γ of f
are homotopic

$$\begin{array}{ccc} \mathcal{P} & \rightarrow & A \\ \varphi \downarrow \downarrow \gamma & & \downarrow f \\ Q & \rightarrow & B \end{array}$$

• Additive functors preserve homotopies

$\Rightarrow F(\varphi), F(\gamma)$ are homotopic

• Homotopic maps induce the same map in homology

$\Rightarrow H_i(F(\varphi)) = H_i(F(\gamma)) \quad \checkmark$

③ Idea: $L_i F = H_i \cdot F$ is a composition of additive functors

④ $\mathcal{P}_1 \rightarrow \mathcal{P}_0 \rightarrow A \rightarrow 0$ exact

F right exact

$\Rightarrow F(\mathcal{P}_1) \rightarrow F(\mathcal{P}_0) \rightarrow F(A) \rightarrow 0$ exact

$\Rightarrow H_0(F(\mathcal{P})) = \text{coker}(F(\mathcal{P}_1) \rightarrow F(\mathcal{P}_0)) = F(A)$

$$\left(\begin{array}{l} \text{ker}(F(\mathcal{P}_0) \rightarrow 0) = 1_{F(\mathcal{P}_0)} \Rightarrow \text{im } F(\partial_1) \xrightarrow{\text{canonical}} F(\mathcal{P}_0) = \text{im } F(\partial_1) \\ \text{exactness} \Rightarrow \text{im } F(\partial_1) = \text{ker}(F(\mathcal{P}_0) \xrightarrow{\text{epi}} F(A)) \\ \text{epi} = \text{coker ker} \Rightarrow F(\mathcal{P}_0) \rightarrow F(A) = \text{coker im } F(\partial_1) \end{array} \right)$$

Remark \mathcal{A} has enough injectives $\Rightarrow \mathcal{A}^{\text{op}}$ has enough projectives

F (covariant) left exact $\Rightarrow F^{\text{op}}$ right exact

$$R^i F = (L_i(F^{\text{op}}))^{\text{op}}$$

Theorem \mathcal{A} abelian category with enough projectives

F right exact covariant functor

Any ses $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ gives rise to a LES

$$\dots \rightarrow L_2 F(C) \rightarrow L_1 F(A) \rightarrow L_1 F(B) \rightarrow L_1 F(C) \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$$

Proof Fix projective resolutions

$$P \xrightarrow{\sim} A \quad R \xrightarrow{\sim} C$$

Horseshoe lemma \Rightarrow Can construct resolution Q of B st

$$0 \rightarrow P \rightarrow Q \rightarrow R \rightarrow 0 \quad \text{ses}$$

\Rightarrow For each n , $0 \rightarrow P_n \rightarrow Q_n \rightarrow R_n \rightarrow 0$ split ses

$\Rightarrow 0 \rightarrow F(P_n) \rightarrow F(Q_n) \rightarrow F(R_n) \rightarrow 0$ ses for all n

$\Rightarrow 0 \rightarrow F(P) \rightarrow F(Q) \rightarrow F(R) \rightarrow 0$ ses

the LES in homology is the sequence we are looking for

Back to R-mod: Ext and Tor
R ring

$$\text{Tor}_i^R(M, N) := L_i(M \otimes_R -)(N) \stackrel{\text{iso}}{=} L_i(- \otimes_R N)(M)$$

$$\text{Ext}_R^i(M, N) := R^i \text{Hom}_R(M, -)(N) \stackrel{\text{iso}}{=} R^i \text{Hom}_R(-, N)(M)$$

Double complex family of objects $\{C_{p,q}\}_{p,q \in \mathbb{Z}}$

together with arrows $d^h: C_{p,q} \rightarrow C_{p-1,q}$ and $d^v: C_{p,q} \rightarrow C_{p,q-1}$

satisfying $d^h d^h = 0$, $d^v d^v = 0$, $d^h d^v + d^v d^h = 0$

$$\begin{array}{ccccc}
 & & \vdots & & \vdots \\
 & & d^v \downarrow & & \downarrow \\
 \dots & \leftarrow & C_{p-1, q+1} & \xleftarrow{d^h} & C_{p, q+1} & \leftarrow \dots \\
 & & d^v \downarrow & & \downarrow \\
 \dots & \leftarrow & C_{p-1, q} & \xleftarrow{d^h} & C_{p, q} & \leftarrow \dots \\
 & & d^v \downarrow & & \downarrow \\
 & & \vdots & & \vdots
 \end{array}$$

the total complex of a double complex C is the complex $\text{Tot}^\oplus(C)$

$$\text{Tot}^\oplus(C)_n := \bigoplus_{p+q=n} C_{p,q}$$

with differential $d := d^h + d^v$

the product total complex of C is $\text{Tot}^\pi(C)$ with
 $\text{Tot}^\pi(C)_n = \bigoplus_{p+q=n} C_{p,q}$ and differential $d = d^h + d^v$

Most important examples R -mod

① tensor product double complex of C and D

$$(C \otimes D)_{p,q} = C_p \otimes_R D_q$$

$$d^h := \partial^C \otimes_R 1_D \quad d^v := (-1)^p 1_C \otimes_R \partial^D$$

tensor product total complex = tensor product of C and D

$$(C \otimes D)_n := \bigoplus_{p+q=n} C_p \otimes_R D_q$$

$$d(x \otimes y) = \partial(x) \otimes y + (-1)^p x \otimes \partial(y)$$

$x \in C_p, y \in D_q$

② Hom double complex of C and D in $\text{Ch}(R)$

$$\text{Hom}(C, D)_{p,q} = \text{Hom}_R(C_{-p}, D_q)$$

$$\text{with differentials } \begin{array}{ccc} \text{Hom}_R(C_{-p}, D_q) & \longrightarrow & \text{Hom}_R(C_{-p-1}, D_q) \\ f & \longmapsto & f \circ \partial^C \end{array}$$

$$\text{and } \begin{array}{ccc} \text{Hom}_R(C_{-p}, D_q) & \longrightarrow & \text{Hom}_R(C_{-p}, D_{q-1}) \\ f & \longmapsto & (-1)^{p+q+1} \partial^D \circ f \end{array}$$

Internal Hom complex of C and \mathcal{Q} = $\text{Tot}^\pi(\text{Hom}(C, \mathcal{Q}))$

$$\text{Hom}(C, \mathcal{Q})_n = \sum_{p+q=n} \text{Hom}_R(C_{-p}, \mathcal{Q}_q)$$

with differential $d(f) = f \circ \partial^C + (-1)^{p+q+1} \partial^D \circ f$

Remarks

1) $Z_0(\text{Hom}(C, \mathcal{Q})) \equiv \text{Hom}_{\text{Ch}(R)}(C, \mathcal{Q})$

because:

0-cycle $\Leftrightarrow C_k \xrightarrow{f_k} \mathcal{Q}_k \in \text{Hom}_R(C_k, \mathcal{Q}_k)$ such that

$$f \circ \partial^C - \partial^D \circ f = d(f) = 0$$

2) $B_0(\text{Hom}(C, \mathcal{Q})) \equiv \text{homotopies of maps } C \rightarrow \mathcal{Q}$

because

0-boundary $\Leftrightarrow C_k \xrightarrow{f_k} \mathcal{Q}_k \in \text{Hom}_R(C_k, \mathcal{Q}_k)$ such that

$$\exists C_k \xrightarrow{h_k} \mathcal{Q}_{k+1} \in \text{Hom}_R(C_k, \mathcal{Q}_{k+1})$$

with $d(h) = f \Leftrightarrow f_k = \partial^D \circ h_k - h_{k-1} \circ \partial^C$
